

SelfAct™

Selfacting Control Valve

PN 10 - 40 , DN 15 - 200

Experience In Motion

Application

Self-actuating Pressure Reducing Valves are used to provide a constant pressure **downstream** of its built-in position. Suitable for steam, non inflammable vapours and gases and neutral liquids.

Product features

Body shape gives optimum flow characteristic

- Excellent flow dynamics when correctly selected
- Heavy top guided plug
- Largest possible kvs-values
- High degree of accuracy in the outlet pressure by carefully selected springs

Long service life and operational reliability

- Maintenance free
- Strong guide, giving minimum vibration and wear
- The valve stem is sealed by a CrNi-steel bellows which is also used to pressure balance the valve

Replaceable trim

- Simple maintenance as the valve body remains in the piping when trim is replaced
- Screwed seat

Wide range of application

- Up to 6 adjustment ranges are available per size
- Easy control point setting by the handwheel at any time

Quick delivery

- **SELF**ACT Valves can be delivered within one week

Quality assurance system certified acc. EN ISO 9001 : 2000 including product development.

Schmidt minimal Valve Standards acc. to the Pressure Equipment Directive 97/23/EC Modul H

Pressure Reducing Valve

The Pressure Reducing Valve consists in the main of: Body with the Trim, Bellows and Actuator and > 100 °C a water Seal Tank.

Body with Flange Connection

Rangeability

Standard Rangeability:	Rangeability 1 : 10
------------------------	---------------------

Leakage-class acc. to DIN 3230 Teil 3

Plug	Plug Design	Leakage-class acc. DIN 3230 - BO	Test Medium	Test Pressure (bar)	max. Seat Leakage in % of kvs
standard	metal-to-metal seated, reseated	Class 1 - tight	Air	Working Pressure, max. 6	0,0 - tight

Actuator Selection

Incorporable Actuator Size depends on Adjustment Range and Nominal Size:

Adjustment Range (bar g)	Nominal Size DN												
	15	20	25	32	40	50	65	80	100	125	150	200	
8 - 20	B11							A11	B2				
8 - 16,5										A11			
3,2 - 10								A2					
2,4 - 10								A11					
1,1 - 10	A11												
1,8 - 4,5								A3					
1,2 - 4,0								A3					
0,8 - 3,0								A3					
0,8 - 2,2								A4					
0,4 - 1,5								A4					
0,4 - 1,1								A51					
0,1 - 1,4	A4												
0,1 - 1,0								A4					
0,1 - 0,6								A51		A6			

Deviation

The characteristics of the Pressure Reducing Valve is like a proportional controller. Their construction therefore has a max. permanent deviation dependent on the nominal size and actuator size.

Actuator Size	max. Deviation in ± bar for Actuator / Nominal Size DN ¹⁾											
	15	20	25	32	40	50	65	80	100	125	150	200
B11	0,23	0,37	0,56	0,64	0,90	1,00	1,92					
B2									1,99			
A11	0,11	0,19	0,29	0,32	0,43	0,43	0,68	1,21		1,75	2,12	2,21
A2								0,59	1,02	1,04	1,27	1,32
A3						0,16	0,23	0,32	0,48	0,65	0,79	0,82
A4	0,02	0,02	0,04	0,04	0,06	0,06	0,08	0,11	0,14	0,24	0,28	0,30
A51								0,05	0,07	0,12	0,14	0,15
A6										0,06	0,08	0,08

Operating Medium Temperature > 100 °C

If the medium temperature is > 100 °C the use of a Seal Tank is essential otherwise the diaphragm of the actuator will be destroyed !

Seal Tank	Nominal Size DN												
	15	20	25	32	40	50	65	80	100	125	150	200	
1	G1												
2								G2					
3										G3			

¹⁾ The actual deviation depends on utilisation of the flow range:

Example DN 125 and actuator A2 -> max. deviation = ± 1,04 bar
 kvs value max. 150 m³/h, actually used kvs value = 111 m³/h -> utilisation = 74 % } the actually deviation = 1,04 x 0,74 = ± 0,77 bar

Installation recommendation

The successful employment of the Pressure Reducing Valve depends directly on a suitable design of the mounting arrangement. As the function of the Pressure Reducing Valve depends greatly on the consideration of the physical possibilities, it is recommended to observe the stated standard values. Deviations may lead to considerable fluctuations in the control loop for which the Pressure Reducing Valve manufacturer rejects any liability whatsoever. In borderline cases, an expensive conversion of the piping should be expected. Even though the physical processes may in individual cases justify a deviation from the standard values, however, this requires a comprehensive system knowledge and the express approval of the manufacturer.

Physical requirements

- Pressure Reducing Valves are used primarily for **steam, non inflammable vapours and gases**. It also has limited use for **neutral liquids**, because the close direction of the plug is in the flow direction of the medium and that can produce vibrations (hammer) at a utilisation for less than 20 %.
- Realistic **rangeability 1 : 10 !**
- At service conditions of **more than 100 °C** it is necessary to protect the diaphragm against overheating by using a **seal tank !**
- Ensure that the outlet velocity for **vapours and gases** is less than **70 m/s** and **liquids and wet steam** is less than **8 m/s**, otherwise the standards for friction loss, wearing, pressure shock and noise of flow will be increase distinctly.
- The safe load **relative differential pressure** depends on nominal size and is for
 - DN 15 - 50 max. **24 bar**
 - DN 65 - 100 max. **20 bar**
 - DN 150 - 200 max. **15 bar**,
 otherwise the trim can be overloaded.

System requirements

- System drawings with design recommendation. Experience shows that deviations result in considerable problems.

For installing a water seal tank be carefully to place it higher up than the valve actuator !

Installation

- At service conditions **more than 100 °C** pour water into the filler socket of the seal tank until it emerges from the vent without bubbles. Now close the vent screw and continue filling until the water reaches a height of 35 mm below the top level of the filler socket. After closing the filler socket, the pressure reducing valve is ready to work.
- At service conditions **less than 100 °C** and gaseous the pressure reducing valve is ready to work. In case of liquid, the actuator must be filled completely with liquid by using its upper vent screw.

A4	0,02	0,02	0,04	0,04	0,06	0,06	0,08	0,11	0,14
A51								0,05	0,07

Operating Medium Temperature > 100 °C

If the medium temperature is > 100 °C the use of a Seal Tank is essential otherwise the diaphragm of the actuator will be destroyed !

Seal Tank	Nominal Size DN								
	15	20	25	32	40	50	65	80	100
1	G1								
2								G2	

¹⁾ The actual deviation depends on utilisation of the flow range:
 Example DN 50 and actuator B11 -> max. deviation = ± 1,00 bar
 kvs-value max. 25 m³/h, actually used kvs-value 18,5 m³/h -> utilisation = 74 % } the actually deviation = 1,00 x 0,74 = ± 0,74 bar

Installation recommendation

The successful employment of the Pressure Relief Valve depends directly on a suitable design of the mounting arrangement. As the function of the Pressure Relief Valve depends greatly on the consideration of the physical possibilities, it is recommended to observe the stated standard values. Deviations may lead to considerable fluctuations in the control loop for which the Pressure Relief Valve manufacturer rejects any liability whatsoever. In borderline cases, an expensive conversion of the piping should be expected. Even though the physical processes may in individual cases justify a deviation from the standard values, however, this requires a comprehensive system knowledge and the express approval of the manufacturer.

Physical requirements

- Pressure Relief Valves are used primarily for **steam, non inflammable vapours and gases**. It also has a limited use for **neutral liquids**, because the close direction of the plug is in the flow direction of the medium and that can produce vibrations (hammer) at a utilisation for less than 20 %.
- Realistic **rangeability 1 : 10 !**
- At service conditions of **more than 100 °C** it is necessary to protect the diaphragm against overheating by using a **seal tank !**
- Ensure that the outlet velocity for **vapours and gases** is less than **70 m/s** and **liquids and wet steam** is less than **8 m/s**, otherwise the standards for friction loss, wearing, pressure shock and noise of flow will be increase distinctly.
- The safe load **relative differential pressure** depends on nominal size and is for
 - DN 15 - 50 max. **24 bar**
 - DN 65 - 100 max. **20 bar**
 - DN 150 - 200 max. **15 bar**,
 otherwise the trim can be overload.

System requirements

- System drawings with design recommendation. Experience shows that deviations result in considerable problems.

For installing a water seal tank be carefully to place it higher up than the valve actuator !

Installation

- At service conditions **more than 100 °C** pour water into the filler socket of the seal tank until it emerges from the vent without bubbles. Now close the vent screw and continue filling until the water reaches a height of 35 mm below the top level of the filler socket. After closing the filler socket, the pressure reducing valve is ready to work.
- At service conditions **less than 100 °C** and gaseous the pressure reducing valve is ready to work. In case of liquid, the actuator must be filled completely with liquid by using its upper vent screw.

Diagram to select the Kvs - value for water

• Example - **water:**

Differential Pressure Δp 2,4 bar
 Volume Flow Rate Q 3,8 m³/h

The operational data are registered in the diagram below for the example. The intersecting point shows the kvs-value as a result from differential pressure and volume flow rate. In case of an intersecting point between two kvs-lines the bigger one has to be chosen.

• Solution > Kvs-value 3,0 m³/h

Diagram to select the Kvs - value for water

Tolerance of Kvs-values (± 10 % acc. to VDI / VDE 2173) is considered in the diagram !

Diagram to select the Kvs - value for steam

• Example - **saturated steam:**

Upstream Pressure p_1 11,5 bar (g)
 Differential Pressure Δp 2 bar
 Mass Flow Rate W 1 200 kg/h

The operational data are registered in the diagram beside for the example. The intersecting point shows the kvs-value as a result from upstream pressure, differential pressure and mass flow rate. In case of an intersecting point between two kvs-lines the bigger one has to be chosen.

• Solution > Kvs-value 15 m³/h

• Example - **superheated steam:**

Upstream Pressure p_1 11,5 bar (g)
 Differential Pressure Δp 2 bar
 Upstr. Temperature t_1 350 °C
 Mass Flow Rate W 1 200 kg/h

The operational data are registered in the diagram beside for the example. The intersecting point shows the kvs-value as a result from upstream pressure, upstream temperature and mass flow rate combined with upstream pressure and differential pressure. In case of an intersecting point between two kvs-lines the bigger one has to be chosen.

• Solution > Kvs-value 25 m³/h
